ABSTRACT

The invention relates to a glass and a glass-ceramic comprising beta-quartz and/or keatite solid solutions, and to a process for their production, and to their use as substrate material for coating. Glass-ceramic comprising beta-quartz and/or keatite solid solutions with a surface roughness without polishing of Ra < 50 nm, a thermal expansion in the temperature range between 20°C and 300°C of < $1.2 \cdot 10^{-6}/\text{K}$, a transmission in the near infrared region at 1050 nm of > 85% for a 4 mm thickness, and a composition in % by weight, based on the total composition, containing:
